

Today's Vascular Surgeon Surgery is only part of our storySM

Focused on creating strong partnerships with podiatrists for comprehensive vascular care.

Comprehensive vascular care for limb salvage requires close collaboration and communication between podiatrists and vascular surgeons. Such collaboration is especially important when treating patients with lower extremity wounds and diabetic foot ulcers, many of whom suffer from peripheral artery disease.

Working together, we develop patient-centered care plans based on our established, evidence-based care pathways, the latest research and advances. Many of these pathways have been formulated through collaboration of the SVS and the APMA, including new insights on prevention, diagnosis, and ongoing management of vascular disease.

We envision partnering with you to make comprehensive vascular care part of your patients' healthy future. Preventing unnecessary amputations and maintaining independent ambulatory and high functional status for our patients is best accomplished by teamwork between podiatrists and vascular surgeons.

To gain insight into how a vascular surgeon can help you and your patient, contact us today:
